On Zilber's resricted Trichotomy Conjecture

Assaf Hasson

June 27, 2019

Hasson: Zilber's restricted Trichotomy

< ロ > < 同 > < 回 > < 回 > < 回 > <

э.

A theorem of Baldwin and Lachlan

Theorem (Baldwin-Lachlan)

Let T be a countable uncountably categorical theory. Then T has a prime model, \mathcal{M}_0 . A strongly minimal set S is definable in \mathcal{M}_0 and any two models $\mathcal{M}_1, \mathcal{M}_2 \models T$ are isomorphic if and only if $\dim_{\mathcal{M}_1}(S) = \dim_{\mathcal{M}_2}(S)$.

< 日 > < 同 > < 回 > < 回 > < 回 > <

э.

A theorem of Baldwin and Lachlan

Theorem (Baldwin-Lachlan)

Let T be a countable uncountably categorical theory. Then T has a prime model, \mathcal{M}_0 . A strongly minimal set S is definable in \mathcal{M}_0 and any two models $\mathcal{M}_1, \mathcal{M}_2 \models T$ are isomorphic if and only if $\dim_{\mathcal{M}_1}(S) = \dim_{\mathcal{M}_2}(S)$.

We remind that:

Definition

A set S definable in an \aleph_0 -saturated structure \mathcal{M} is strongly minimal if every definable subset of S (not S^n !) is either finite or co-finite.

э.

The classical examples

The classical examples of strongly minimal sets are:

Example

- 1. An infinite set with no structure.
- 2. A vector space V over a field K in the language $\langle V; 0, +, \lambda \cdot \rangle_{\lambda \in K}$.
- 3. An algebraically closed field in the language of rings.

The classical examples

The classical examples of strongly minimal sets are:

Example

- 1. An infinite set with no structure.
- 2. A vector space V over a field K in the language $\langle V; 0, +, \lambda \cdot \rangle_{\lambda \in K}$.
- 3. An algebraically closed field in the language of rings.

There are many other examples:

- 1. An infinite regular binary tree.
- 2. A projective or affine space over a field K.
- 3. An algebraic curve over an algebraically closed field K.

Pre-geometries

Definition

A pregeometry is a pair $\langle X, \mathrm{cl} \rangle$ where $\mathrm{cl} : \mathbb{P}(X) \to \mathbb{P}(X)$ satisfies:

3

Pre-geometries

Definition

A pregeometry is a pair $\langle X, \mathrm{cl} \rangle$ where $\mathrm{cl} : \mathbb{P}(X) \to \mathbb{P}(X)$ satisfies: :

- 1. $cl(A) \supseteq A$ for all A.
- 2. $\operatorname{cl}(\operatorname{cl}(A)) = \operatorname{cl}(A)$ for all A.
- 3. $cl(A) \subseteq cl(B)$ for all $A \subseteq B$.
- 4. $\operatorname{cl}(A) = \bigcup \{ \operatorname{cl}(A_0) : A_0 \subseteq A, A_0 \text{ finite} \}.$
- 5. Exchange: if $a \in cl(Ab) \setminus cl(A)$ then $b \in cl(Aa)$.

Exchange allows us to show – as in linear algebra – that any two maximal independent sets in a pre-geometry have the same cardinality.

Theorem (Hrushovski)

There are non-locally modular strongly minimal sets not interpreting a group.

Theorem (Hrushovski-Zilber)

Zilber's Conjecture is true for Zariski Geometries.

Wrong, but not completely

Theorem (Hrushovski)

There are non-locally modular strongly minimal sets not interpreting a group.

Theorem (Hrushovski-Zilber)

Zilber's Conjecture is true for Zariski Geometries.

Zariski Geometries are a first order topological framework, essentially, axiomatizing the Zariski topology on (Cartesian powers of) regular algebraic curves over algebraically closed fields.

An example of a different flavour

Theorem (Rabinovich)

If \mathcal{D} is a strongly minimal reduct of an algebraically closed field then \mathcal{D} satisfies Zilber's trichotomy.

< ロ > < 同 > < 回 > < 回 > < 回 >

An example of a different flavour

Theorem (Rabinovich)

If \mathcal{D} is a strongly minimal reduct of an algebraically closed field then \mathcal{D} satisfies Zilber's trichotomy.

Definition

If \mathcal{M} is a structure a structure \mathcal{N} is a redct of \mathcal{M} if it shares the same universe and every \emptyset -definable set of \mathcal{N} is \mathcal{M} -definable.

- 4 同 ト - 4 三 ト - 4 三 ト

An example of a different flavour

Theorem (Rabinovich)

If \mathcal{D} is a strongly minimal reduct of an algebraically closed field then \mathcal{D} satisfies Zilber's trichotomy.

Definition

If \mathcal{M} is a structure a structure \mathcal{N} is a redct of \mathcal{M} if it shares the same universe and every \emptyset -definable set of \mathcal{N} is \mathcal{M} -definable.

Why of a different flavour?

In all previous examples the topology was available to help produce the field.

An example of a different flavour

Theorem (Rabinovich)

If \mathcal{D} is a strongly minimal reduct of an algebraically closed field then \mathcal{D} satisfies Zilber's trichotomy.

Definition

If \mathcal{M} is a structure a structure \mathcal{N} is a redct of \mathcal{M} if it shares the same universe and every \emptyset -definable set of \mathcal{N} is \mathcal{M} -definable.

Why of a different flavour?

In all previous examples the topology was available to help produce the field. In Rabinovich's result the topology only exists in the background – restricting the behaviour of definable sets.

< 日 > < 同 > < 回 > < 回 > < 回 > <

э.

So what what do we make of Zilber's Trichotomy?

Zilber's Principle

The Trichotomy holds in any geometric structure where definable sets are constrained by a tame topology.

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

ъ

So what what do we make of Zilber's Trichotomy?

Zilber's Principle

The Trichotomy holds in any geometric structure where definable sets are constrained by a tame topology.

Conjecture

A few words on Peterzil's conjecture

A far reaching conjecture:

Peterzil's conjecture covers structures interpretable for example in:

 $\blacktriangleright \mathbb{R}_{an,exp} := \langle \mathbb{R}; +, \times, \leq, e^{x}, f : f \text{ analytic on } [0,1] \rangle.$

In particular any strongly minimal set interpretable in a compact complex manifold falls into Peterzil's conjecture.

・ロト ・ 一下・ ・ 日 ・ ・ 日 ・

A few words on Peterzil's conjecture

A far reaching conjecture:

Peterzil's conjecture covers structures interpretable for example in:

 $\blacktriangleright \mathbb{R}_{an,exp} := \langle \mathbb{R}; +, \times, \leq, e^{x}, f : f \text{ analytic on } [0,1] \rangle.$

In particular any strongly minimal set interpretable in a compact complex manifold falls into Peterzil's conjecture.

An even wider conjecture of Peterzil's:

A geometric structure interpretable in a distal theory satisfies Zilber's Trichotomy.

A few words on Peterzil's conjecture

A far reaching conjecture:

Peterzil's conjecture covers structures interpretable for example in:

 $\blacktriangleright \mathbb{R}_{an,exp} := \langle \mathbb{R}; +, \times, \leq, e^{x}, f : f \text{ analytic on } [0,1] \rangle.$

In particular any strongly minimal set interpretable in a compact complex manifold falls into Peterzil's conjecture.

An even wider conjecture of Peterzil's:

A geometric structure interpretable in a distal theory satisfies Zilber's Trichotomy.

Example

Every o-minimal theory is distal, and every expansion of an o-minimal theory by externally definable sets is distal. Also, \mathbb{Q}_p is distal.

The restricted Trichotomy in ACF

Theorem (H.-Sustretov)

イロト イポト イヨト イヨト

э.

The restricted Trichotomy in ACF

Theorem (H.-Sustretov)

Let M be a curve over an algebraically closed field K, M the structrue with universe M and some of the K-induced structure. Then M satisfies Zilber's Trichotomy.

This generalises Rabinovich' theorem (and provides a new, shorter, proof).

イロト イポト イヨト イヨト

The restricted Trichotomy in ACF

Theorem (H.-Sustretov)

- This generalises Rabinovich' theorem (and provides a new, shorter, proof).
- The conjecture remains open if the universe of the strongly minimal set is not a curve (i.e., of higher dimension).

The restricted Trichotomy in ACF

Theorem (H.-Sustretov)

- This generalises Rabinovich' theorem (and provides a new, shorter, proof).
- The conjecture remains open if the universe of the strongly minimal set is not a curve (i.e., of higher dimension).
- If the conjecture is true then the higher dimensional case of the conjecture should be, essentially, vacuous.
- There are good reasons to believe that the proof would go through to ACVF.

Peterzil's conjecture

Theorem (H.-Onshuus)

Let \mathcal{M} be a structure interpretable in an o-minimal theory, p an unstable type. Then p satisfies Zilber's Trichotomy.

э.

Peterzil's conjecture

Theorem (H.-Onshuus)

Let \mathcal{M} be a structure interpretable in an o-minimal theory, p an unstable type. Then p satisfies Zilber's Trichotomy.

This reduces Peterzil's conjecture to strongly minimal structures interpretable in o-minimal theories:

< 日 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Peterzil's conjecture

Theorem (H.-Onshuus)

Let \mathcal{M} be a structure interpretable in an o-minimal theory, p an unstable type. Then p satisfies Zilber's Trichotomy.

This reduces Peterzil's conjecture to strongly minimal structures interpretable in o-minimal theories:

Theorem (H-Onshuus-Peterzil)

If the universe of the interpretation is 1-dimensional, then the strongly minimal set is locally modular.

Remark

As in the case of ACF, if Peterzil's conjecture is true then a strongly minimal structure interpretable in an o-minimal structure is either locally modular, or 2-dimensional.

э.

Peterzil's conjecture – cont.

Theorem (Eleftheriou-H.-Peterzil)

Assume that \mathcal{G} is a strongly minimal group interpretable in an o-minimal expansion of a field, with 2-dimensional universe. If \mathcal{G} is not locally modular then \mathcal{G} is an algebraic group over an algebraically closed field.

Theorem (Eleftheriou-H.-Peterzil)

Assume that \mathcal{G} is a strongly minimal group interpretable in an o-minimal expansion of a field, with 2-dimensional universe. If \mathcal{G} is not locally modular then \mathcal{G} is an algebraic group over an algebraically closed field.

- As in the case of algerbaically closed fields nothing is known in case the universe of the strongly minimal group is of dimension greater than 2.
- The topology on G is not the affine topology, but the group topology.
- What would be the right topology in case a group is not given?

Some final words

Is there are model theoretic theory of tangency that would give a framework for Zilber's Trichotomy.

< 日 > < 同 > < 回 > < 回 > < 回 > <

э.

Some final words

- Is there are model theoretic theory of tangency that would give a framework for Zilber's Trichotomy.
- Zilber's full-fledged Trichotomy conjecture also suggested a complete classification of geometries of strongly minimal sets.

Some final words

- Is there are model theoretic theory of tangency that would give a framework for Zilber's Trichotomy.
- Zilber's full-fledged Trichotomy conjecture also suggested a complete classification of geometries of strongly minimal sets.
- Can one formulate such a conjecture withstanding Hrushovski's and other counter examples?

Some final words

- Is there are model theoretic theory of tangency that would give a framework for Zilber's Trichotomy.
- Zilber's full-fledged Trichotomy conjecture also suggested a complete classification of geometries of strongly minimal sets.
- Can one formulate such a conjecture withstanding Hrushovski's and other counter examples?
- There are some promising attempts (due mostly to Mermelstein). It seems that reducts may have an important role to play.

Thank you!
