Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients. Questions:

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

#### **Questions:**

1. Is it solvable in  $\mathbb{Z}$ ?

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

### **Questions:**

- 1. Is it solvable in  $\mathbb{Z}$ ?
- 2. If yes, what does the solution set look like? For instance, is it finite or infinite?

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

#### **Questions:**

- 1. Is it solvable in  $\mathbb{Z}$ ?
- 2. If yes, what does the solution set look like? For instance, is it finite or infinite?

Example

1.  $x^2 + y^2 = z^2$ . There are infinitely many integer solutions which are precisely the Pythagorean triples:

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

#### **Questions:**

- 1. Is it solvable in  $\mathbb{Z}$ ?
- 2. If yes, what does the solution set look like? For instance, is it finite or infinite?

Example

1.  $x^2 + y^2 = z^2$ . There are infinitely many integer solutions which are precisely the Pythagorean triples:

$$x = m^2 - n^2, y = 2mn, z = m^2 + n^2$$

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

#### **Questions:**

- 1. Is it solvable in  $\mathbb{Z}$ ?
- 2. If yes, what does the solution set look like? For instance, is it finite or infinite?

Example

1.  $x^2 + y^2 = z^2$ . There are infinitely many integer solutions which are precisely the Pythagorean triples:

$$x = m^2 - n^2, y = 2mn, z = m^2 + n^2$$

(Book X, Euclid 300 BC)

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

#### **Questions:**

(Book X, Euclid 300 BC)

2. 
$$x^n + y^n = z^n$$
 and  $n > 2$ . It has no integer solutions with  $xyz \neq 0$ . (Wiles 1994)  
[ $n = 4$  Fermat (1637),  $n = 3$  Euler (1750)]

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

#### **Questions:**

- 1. Is it solvable in  $\mathbb{Z}$ ?
- 2. If yes, what does the solution set look like? For instance, is it finite or infinite?

Example

1.  $x^2 + y^2 = z^2$ . There are infinitely many integer solutions which are precisely the Pythagorean triples:

$$x = m^2 - n^2, y = 2mn, z = m^2 + n^2$$

(Book X, Euclid 300 BC)

x<sup>n</sup> + y<sup>n</sup> = z<sup>n</sup> and n > 2. It has no integer solutions with xyz ≠ 0. (Wiles 1994)
 [n = 4 Fermat (1637), n = 3 Euler (1750)]
 Does x<sup>3</sup> + y<sup>3</sup> + z<sup>3</sup> = 33 have integer solutions?

Let  $P(X_1, ..., X_n) = 0$  be a polynomial equation with integer coefficients.

#### **Questions:**

- 1. Is it solvable in  $\mathbb{Z}$ ?
- 2. If yes, what does the solution set look like? For instance, is it finite or infinite?

Example

1.  $x^2 + y^2 = z^2$ . There are infinitely many integer solutions which are precisely the Pythagorean triples:

$$x = m^2 - n^2, y = 2mn, z = m^2 + n^2$$

(Book X, Euclid 300 BC)

2.  $x^n + y^n = z^n$  and n > 2. It has no integer solutions with  $xyz \neq 0$ . (Wiles 1994) [n = 4 Fermat (1637), n = 3 Euler (1750)]

3. Does  $x^3 + y^3 + z^3 = 33$  have integer solutions? No one knows.

**H10 Problem:** Find an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with integer coefficients is solvable in  $\mathbb{Z}$ .

**H10 Problem:** Find an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with integer coefficients is solvable in  $\mathbb{Z}$ .

One can also consider systems but this reduces to one equation.

**H10 Problem:** Find an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with integer coefficients is solvable in  $\mathbb{Z}$ .

One can also consider systems but this reduces to one equation.

(e.g.,  $P_1 = P_2 = 0 \iff P_1^2 + P_2^2 = 0$ )

**H10 Problem:** Find an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with integer coefficients is solvable in  $\mathbb{Z}$ .

One can also consider systems but this reduces to one equation.

(e.g., 
$$P_1 = P_2 = 0 \iff P_1^2 + P_2^2 = 0$$
)

Theorem (DPRM '70)

No such algorithm exists. Equivalently, Th\_{\exists^+}(\mathbb{Z}) is undecidable in  $L_{rings} = \{+, \cdot, 0, 1\}.$ 

**H10 Problem:** Find an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with integer coefficients is solvable in  $\mathbb{Z}$ .

One can also consider systems but this reduces to one equation.

(e.g., 
$$P_1 = P_2 = 0 \iff P_1^2 + P_2^2 = 0$$
)

Theorem (DPRM '70)

No such algorithm exists. Equivalently, Th\_{\exists^+}(\mathbb{Z}) is undecidable in  $L_{rings} = \{+, \cdot, 0, 1\}.$ 

This would certainly come as a surprise to Hilbert.

**H10 Problem:** Find an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with integer coefficients is solvable in  $\mathbb{Z}$ .

One can also consider systems but this reduces to one equation.

(e.g., 
$$P_1 = P_2 = 0 \iff P_1^2 + P_2^2 = 0$$
)

### Theorem (DPRM '70)

No such algorithm exists. Equivalently, Th\_{\exists^+}(\mathbb{Z}) is undecidable in L\_{rings} = \{+,\cdot,0,1\}.

This would certainly come as a surprise to Hilbert.

There are (at least) three possible ways of extending H10 problem:

**H10 Problem:** Find an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with integer coefficients is solvable in  $\mathbb{Z}$ .

One can also consider systems but this reduces to one equation.

(e.g.,

**H10 Problem:** Find an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with integer coefficients is solvable in  $\mathbb{Z}$ .

One can also consider systems but this reduces to one equation.

(e.g., 
$$P_1 = P_2 = 0 \iff P_1^2 + P_2^2 = 0$$
)

### Theorem (DPRM '70)

No such algorithm exists. Equivalently, Th\_{\exists^+}(\mathbb{Z}) is undecidable in  $L_{rings} = \{+, \cdot, 0, 1\}.$ 

This would certainly come as a surprise to Hilbert.

There are (at least) three possible ways of extending H10 problem:

- Change the domain where we look for solutions. (H10/R) (e.g., instead of Z, consider C or R or Q<sub>p</sub> or Q (!))
- 2. Consider more general sentences (not just existential ones). (It was already known in the '30s that  $Th(\mathbb{Z})$  is undecidable, Gödel, Church, Turing.)
- 3. Change the language.

Pheidas did some work on  $H10/\mathbb{Q}$ 

Perhaps the prominent open problem in the area is  $H10/\mathbb{Q}$ :

### Problem

Is there an algorithm to decide whether a given polynomial equation  $P(X_1, ..., X_n) = 0$  with rational coefficients is solvable in  $\mathbb{Q}$ ?

#### **Remarks:**

- ► Most experts expect the answer to be negative (just as H10/Z).
- ► It sounds like this should follow easily from the case over Z by simply "clearing denominators" but this is not the case!
- ► Towards an answer to H10/Q, it may be instructive to look at fields whose arithmetic is similar to Q.
- There is a classical analogy between Q and fields of rational functions F(t) (F a field), whose elements are of the form f(t)/g(t), where f(t), g(t) ∈ F[t] and g(t) ≠ 0.

**Pheidas** did some work on  $H10/\mathbb{Q}$  but the most definitive and striking results he obtained were about function fields.

 $\mathbb{Q}$  vs  $\mathbb{F}_p(t)$ 

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

・ロト・日・・ヨト ヨー りへで

These two fields are remarkably similar:

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

1. They both have a notion of a "ring of integers".

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$ 

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).

3.1 The prime 2 gives rise to  $|_2$ :

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).

3.1 The prime 2 gives rise to  $||_2$ : To compute  $|m|_2$ , write  $m = 2^s \cdot n$  with  $2 \nmid n$ .

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).

3.1 The prime 2 gives rise to  $||_2$ : To compute  $|m|_2$ , write  $m = 2^s \cdot n$  with  $2 \nmid n$ . Then  $|m|_2 = 1/2^s$ .

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).
  - 3.1 The prime 2 gives rise to  $| |_2$ : To compute  $|m|_2$ , write  $m = 2^s \cdot n$  with  $2 \nmid n$ . Then  $|m|_2 = 1/2^s$ . The completion of  $\mathbb{Q}$  w.r.t.  $| |_2$  is denoted by  $\mathbb{Q}_2$ .

3.2 The 'prime' t gives rise to  $|_t$ :

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).
  - 3.1 The prime 2 gives rise to  $| |_2$ : To compute  $|m|_2$ , write  $m = 2^s \cdot n$  with  $2 \nmid n$ . Then  $|m|_2 = 1/2^s$ . The completion of  $\mathbb{Q}$  w.r.t.  $| |_2$  is denoted by  $\mathbb{Q}_2$ .

3.2 The 'prime' t gives rise to  $| |_t$ : To compute  $|f|_t$ , write  $f = t^s \cdot g$  with  $t \nmid g$ .

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).
  - 3.1 The prime 2 gives rise to  $| |_2$ : To compute  $|m|_2$ , write  $m = 2^s \cdot n$  with  $2 \nmid n$ . Then  $|m|_2 = 1/2^s$ . The completion of  $\mathbb{Q}$  w.r.t.  $| |_2$  is denoted by  $\mathbb{Q}_2$ .

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).
  - 3.1 The prime 2 gives rise to  $| |_2$ : To compute  $|m|_2$ , write  $m = 2^s \cdot n$  with  $2 \nmid n$ . Then  $|m|_2 = 1/2^s$ . The completion of  $\mathbb{Q}$  w.r.t.  $| |_2$  is denoted by  $\mathbb{Q}_2$ .
  - 3.2 The 'prime' t gives rise to  $||_t$ : To compute  $|f|_t$ , write  $f = t^s \cdot g$  with  $t \nmid g$ . Then  $|f|_t = 1/2^s$ . We write  $s = ord_t(x)$ .

$$\mathbb{Q}$$
 vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- 3. Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).
  - 3.1 The prime 2 gives rise to  $| |_2$ : To compute  $|m|_2$ , write  $m = 2^s \cdot n$  with  $2 \nmid n$ . Then  $|m|_2 = 1/2^s$ . The completion of  $\mathbb{Q}$  w.r.t.  $| |_2$  is denoted by  $\mathbb{Q}_2$ .
  - 3.2 The 'prime' t gives rise to  $||_t$ : To compute  $|f|_t$ , write  $f = t^s \cdot g$  with  $t \nmid g$ . Then  $|f|_t = 1/2^s$ . We write  $s = ord_t(x)$ . The completion of  $\mathbb{F}_p(t)$  w.r.t.  $ord_t(x)$  is denoted by  $\mathbb{F}_p(t)$ .

 $\mathbb{Q}$  vs  $\mathbb{F}_p(t)$ 

These two fields are remarkably similar:

- 1. They both have a notion of a "ring of integers".  $(\mathbb{Z} \subseteq \mathbb{Q} \text{ vs } \mathbb{F}_p[t] \subseteq \mathbb{F}_p(t).)$
- 2. Both rings have a notion of a "prime" element and satisfy a version of the fundamental theorem of arithmetic.
- Each "prime" defines an absolute value and the completed field w.r.t. that absolute value is locally compact (just like ℝ).
  - 3.1 The prime 2 gives rise to  $| |_2$ : To compute  $|m|_2$ , write  $m = 2^s \cdot n$  with  $2 \nmid n$ . Then  $|m|_2 = 1/2^s$ . The completion of  $\mathbb{Q}$  w.r.t.  $| |_2$  is denoted by  $\mathbb{Q}_2$ .
  - 3.2 The 'prime' t gives rise to  $| |_t$ : To compute  $|f|_t$ , write  $f = t^s \cdot g$  with  $t \nmid g$ . Then  $|f|_t = 1/2^s$ . We write  $s = ord_t(x)$ . The completion of  $\mathbb{F}_p(t)$  w.r.t.  $ord_t(x)$  is denoted by  $\mathbb{F}_p((t))$ .

**Remark:** Properties (1)-(3) in fact "axiomatize" completely these fields. (Artin-Whaples '45)

Theorem (Pheidas '91 for p > 2, Videla '94 for p = 2) Hilbert's tenth problem over  $\mathbb{F}_p(t)$  is undecidable.

Theorem (Pheidas '91 for p > 2, Videla '94 for p = 2) Hilbert's tenth problem over  $\mathbb{F}_p(t)$  is undecidable. Equivalently, the existential theory of  $\mathbb{F}_p(t)$  is undecidable in the language of rings with a constant for t.

Theorem (Pheidas '91 for p > 2, Videla '94 for p = 2) Hilbert's tenth problem over  $\mathbb{F}_p(t)$  is undecidable. Equivalently, the existential theory of  $\mathbb{F}_p(t)$  is undecidable in the language of rings with a constant for t.

Why is this result important?

Theorem (Pheidas '91 for p > 2, Videla '94 for p = 2) Hilbert's tenth problem over  $\mathbb{F}_p(t)$  is undecidable. Equivalently, the existential theory of  $\mathbb{F}_p(t)$  is undecidable in the language of rings with a constant for t.

Why is this result important?

It is perhaps the strongest piece of evidence that H10 over Q should be undecidable.

Theorem (Pheidas '91 for p > 2, Videla '94 for p = 2) Hilbert's tenth problem over  $\mathbb{F}_p(t)$  is undecidable. Equivalently, the existential theory of  $\mathbb{F}_p(t)$  is undecidable in the language of rings with a constant for t.

Why is this result important?

It is perhaps the strongest piece of evidence that H10 over Q should be undecidable.

900 E (E) (E) (E) (D)

There is also a uniform version which is even more suggestive:

Theorem (Pheidas '91 for p > 2, Videla '94 for p = 2) Hilbert's tenth problem over  $\mathbb{F}_p(t)$  is undecidable. Equivalently, the existential theory of  $\mathbb{F}_p(t)$  is undecidable in the language of rings with a constant for t.

Why is this result important?

- It is perhaps the strongest piece of evidence that H10 over Q should be undecidable.
- There is also a uniform version which is even more suggestive:

### Theorem (Pasten-Pheidas-Vidaux '13)

There is no algorithm to decide whether a system of polynomial equations with coefficients in  $\mathbb{Z}[t]$  has a solution in  $\mathbb{F}_p[t]$  for all but finitely many p.

Theorem (Pheidas '91 for p > 2, Videla '94 for p = 2) Hilbert's tenth problem over  $\mathbb{F}_p(t)$  is undecidable. Equivalently, the existential theory of  $\mathbb{F}_p(t)$  is undecidable in the language of rings with a constant for t.

Why is this result important?

- It is perhaps the strongest piece of evidence that H10 over Q should be undecidable.
- There is also a uniform version which is even more suggestive:

### Theorem (Pasten-Pheidas-Vidaux '13)

There is no algorithm to decide whether a system of polynomial equations with coefficients in  $\mathbb{Z}[t]$  has a solution in  $\mathbb{F}_p[t]$  for all but finitely many p.

cf. (Ax 1967)

There is an algorithm to decide whether a system of polynomial equations with coefficients in  $\mathbb{Z}$  has a solution in  $\mathbb{F}_p$  for all but finitely many primes p.

H10 over function fields is undecidable: The proof

Theorem (Pheidas '91 for p > 2, Videla '94 for p = 2)

Hilbert's tenth problem over  $\mathbb{F}_p(t)$  is undecidable.

Pheidas encodes Hilbert's 10th problem over  $\mathbb{Z}$  in an ingenious way. Key steps in the proof:

- We identify Z = {ord<sub>t</sub>(x) : x ∈ F<sub>p</sub>(t)}. (The relation ord<sub>t</sub>(x) ≥ 0 is ∃<sup>+</sup>-definable, so we can encode the ∃<sup>+</sup>-theory of (Z, <).)</li>
- 2. Note that  $ord_t(xy) = ord_t(x) + ord_t(y)$ , so we can encode the  $\exists^+$ -theory of  $(\mathbb{Z}, +, <)$ . How to encode multiplication?
- 3. Pheidas first encodes the relation

$$m \mid_{p} n : \iff n = p^{s} \cdot m$$
 for some  $s \in \mathbb{N}$ 

(By showing that " $x = y^{p^s}$ " is  $\exists^+$ -definable in  $\mathbb{F}_p(t)$ .)

- 4. In previous work, Pheidas showed that multiplication is  $\exists^+$ -definable in  $(\mathbb{Z}, +, <, |_p)$ .
- Thus, we can encode the ∃<sup>+</sup>-theory of (Z, +, ·), which is undecidable by the DPRM theorem.

# Hilbert's tenth problem over $\mathbb{F}_{p}((t))$

Does the situation improve if we replace  $\mathbb{F}_{\rho}(t)$  with  $\mathbb{F}_{\rho}((t))$ ?

#### Problem

Is Hilbert's tenth problem over  $\mathbb{F}_{p}((t))$  is decidable? Equivalently, is  $Th_{\exists}(\mathbb{F}_{p}((t)))$  decidable in  $L_{rings}$  with a constant for t?

# Hilbert's tenth problem over $\mathbb{F}_p((t))$

Does the situation improve if we replace  $\mathbb{F}_{\rho}(t)$  with  $\mathbb{F}_{\rho}((t))$ ?

### Problem

Is Hilbert's tenth problem over  $\mathbb{F}_{p}((t))$  is decidable? Equivalently, is  $Th_{\exists}(\mathbb{F}_{p}((t)))$  decidable in  $L_{rings}$  with a constant for t?

#### Note:

Hilbert's 10th problem over  $\mathbb{C}((t))$  is decidable

# Hilbert's tenth problem over $\mathbb{F}_p((t))$

Does the situation improve if we replace  $\mathbb{F}_{\rho}(t)$  with  $\mathbb{F}_{\rho}((t))$ ?

### Problem

Is Hilbert's tenth problem over  $\mathbb{F}_{p}((t))$  is decidable? Equivalently, is  $Th_{\exists}(\mathbb{F}_{p}((t)))$  decidable in  $L_{rings}$  with a constant for t?

#### Note:

Hilbert's 10th problem over  $\mathbb{C}((t))$  is decidable and also the full first-order theory of  $\mathbb{C}((t))$ . (Ax-Kochen/Ershov '66)

Theorem (Denef-Schoutens '03, K. '22, Anscombe-Dittmann-Fehm '23)

H10 over  $\mathbb{F}_p((t))$  is decidable, if one assumes resolution of singularities
